

TrustDesk

Build Dependable Support Operations

(Customer support built for the Modern Era, powered by AI Agents)

WHO WE ARE

TrustDesk is an AI-first support operations platform. Instead of a chatbot that improvises, it retrieves policy, classifies tickets, drafts cited replies, and proposes actions a human approves — leaving an audit trail behind every decision.

THE PROBLEM

Support teams handle thousands of repetitive but high-stakes conversations. Traditional chatbots fail them: they hallucinate answers, ignore company policy, and either take risky actions unsupervised or can't act at all. The result is wrong promises to customers and no way to reconstruct why the AI said what it said.

THE SOLUTION

TrustDesk grounds every reply in the company knowledge base and returns citation IDs with it. It triages incoming tickets by intent, priority, and escalation need; recommends operational actions like refund reviews or replacement orders; and blocks execution until a human approves. When retrieved policy doesn't support an answer, it escalates instead of guessing.

KEY FEATURES

- ◆ **Grounded drafts with citations:** Replies are built from ticket, customer/order context, and retrieved policy docs — each claim traceable to a document ID.
- ◆ **AI triage:** Automatic classification (shipping, refund, warranty, billing, account security, general) with priority and escalation calls.
- ◆ **Approval-gated actions:** AI agent raises a ticket for support request. Idempotency keys ensure retries never double-charge or duplicate an order. Any sensitive support action like refunds require manual approval by support team.
- ◆ **Adversarial guardrails:** Customer messages are filtered to make sure genuine queries are answered, prompt injection, and secret-extraction attempts are refused. Customer claims are matched with database to ensure accurate resolutions.
- ◆ **Traces and evals:** Every AI run is logged (retrieved docs, tool calls, guardrail result, final status). Agent performance is tested with evals. Customers provide feedback for agent resolutions to track and improve agent interactions.

WHAT'S NEXT

Support for multiple organisations and organisation specific customisations. Ability to add custom action for AI agents to support broader use-cases.
